## Chapter 9 Chemical Quantities

## Section 1. Information in chemical equations

Chemical equations can be evaluated by several terms.
$\mathrm{C}_{3} \mathrm{H}_{8}(\mathrm{~g})+5 \mathrm{O}_{2}(\mathrm{~g}) \rightarrow 3 \mathrm{CO}_{2}(\mathrm{~g})+4 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$
Describes:

Review:
Aqueous solutions of silver nitrate and copper (II) sulfate react to produce what?
*Make sure all $\qquad$ are balanced before doing $\qquad$ *

## Section 2: Mole to Mole relationships

This tells us __ moles of water $\qquad$ to $\qquad$ moles of $\qquad$ and __ mole of oxygen.

What if we had $\qquad$ mole of $\qquad$ ?
__ mole of $\qquad$ is produced
__ mole of $\qquad$ is produced
$\qquad$ can be written from balanced equations.

| 2 moles $\mathrm{H}_{2} \underline{\mathrm{O}}$ | 2 moles $\mathrm{H}_{2} \underline{\mathrm{O}}$ | 2 moles $\mathrm{H}_{2}$ |
| :---: | :---: | :---: |
| 2 moles $\mathrm{H}_{2}$ | 1 mole $\mathrm{O}_{2}$ | 1 mole $\mathrm{O}_{2}$ |

Use these as $\qquad$ to do calculations between
$\qquad$ .

If you have $\qquad$ moles of $\qquad$ , how many moles of $\qquad$ will it produce?

## Section 3 Mass Calculations

How much iodine would be needed to completely react with 35.0 g of aluminum?

You should know:
$1 \mathrm{~mol} \mathrm{Al}=\ldots \quad \mathrm{g} \mathrm{Al}$
$1 \mathrm{~mol} \mathrm{I} \mathrm{=} \quad$ g I
_ $\mathrm{mol} \mathrm{Al}=\ldots \mathrm{mol} \mathrm{I}_{2}$
We can change 35.0 g of $\mathrm{Al} \rightarrow$ moles $\mathrm{Al} \rightarrow$ moles $\mathrm{I}_{2} \rightarrow$ grams $\mathrm{I}_{2}$
Self Check 9.3 pg. 258

The $\qquad$ of using $\qquad$ equations to $\qquad$ problems is called $\qquad$ .

How many water molecules were formed in self check 9.3 ?

When 9.2 moles of ammonia are decomposed at STP, what volume of hydrogen is produced?

What is the mass of the hydrogen produced?

## Section 4 Concepts of Limiting Reagent

8 slices of bread, 1 full jar of peanut butter and 1 full jar of jam. Which will you run out of first when you make pb and j 's?
$\qquad$
Which will you have left over?
$\qquad$ = excess reagents

The $\qquad$ in the balanced equation indicate the $\qquad$ required to completely consume all the $\qquad$ with no reactants remaining $\qquad$ . This ratio is called a $\qquad$ . When a mixture is found to contain these $\qquad$ , it is said to be a stoichiometric $\qquad$ . There would be no limiting
$\qquad$ in this scenario.

Most mixtures of reactants are $\qquad$ stoichiometric so the limiting reagent/reactant needs to be $\qquad$ .

This is done when the quantities of $\qquad$ are given in the problem.

Limiting reactant/reagent determines the $\qquad$ produced and is the reactant that runs out $\qquad$ .

## Section 5 Calculations Involving a Limiting Reactant

Step $1=$ using stoichiometry, convert the $\qquad$ of the $\qquad$ reactant to the $\qquad$ of the $\qquad$ in question.
Step 2 = using stoichiometry, convert the $\qquad$ of the second
$\qquad$ to the mass of the $\qquad$ .
Step 3 = the $\qquad$ that $\qquad$ the $\qquad$ amount of
$\qquad$ is the limiting reagent.

Example:
$2.50 \times 10^{4}$ grams of nitrogen and $5.00 \times 10^{3}$ grams of hydrogen react. First determine the limiting reagent, then identify the mass of ammonia produced.
Step 1 -

Step 2 -

Step 3 -

The amount of product produced is $\qquad$ of $\mathrm{NH}_{3}$. This is called the
$\qquad$ —.

Ex. 9.8 pg. 271
$2 \mathrm{NH}_{3}(\mathrm{~g})+3 \mathrm{CuO}(\mathrm{s}) \rightarrow \mathrm{N}_{2}(\mathrm{~g})+3 \mathrm{Cu}(\mathrm{s})+3 \mathrm{H}_{2} \mathrm{O}(\mathrm{g})$

The limiting reagent is $\qquad$ , the amount of $\qquad$ produced is
$\qquad$ —.

## Section 6 Percent Yield

$\qquad$ and $\qquad$ are concerned with
of production. Oftentimes $\qquad$ is used to determine
$\qquad$ .

Theoretical yield is the $\qquad$ amount of product formed from a $\qquad$ equation and given
$\qquad$ of $\qquad$ . This is a $\qquad$ quantity. Actual yield is the $\qquad$ of product $\qquad$ when the process is $\qquad$ carried out.

Percent yield is the $\qquad$ of the $\qquad$ yields based on $\qquad$ .
Ex. During an experiment you obtain 14.6 grams of water and the theoretical yield is 15.4 grams. What is the percent yield?

This next example combines limiting reagent and percent yield.
Using the following reaction, calculate the mass of xenon tetrafluoride that is formed from 130. grams of xenon reacts with 100. grams of $\mathrm{F}_{2}$. Also determine the percent yield if only 145 g of $\mathrm{XeF}_{4}$ is actually isolated.

$$
\mathrm{Xe}(\mathrm{~g})+2 \mathrm{~F}_{2}(\mathrm{~g}) \rightarrow \mathrm{XeF}_{4}(\mathrm{~s})
$$

Limiting reagent is $\qquad$ , the theoretical yield is

Percent yield is
